

Phishing URL Detection System

Subtitle

- GTU 2-Week SBTP 2026
- VEN SHRAVAN KUMAR JEMALBHAI
- Enrollment: 236280307072
- Government Polytechnic, Vadnagar
- Semester: 5th semester

Introduction

- Phishing is a cyber attack.
- Fake websites steal personal information.
- This project detects suspicious URLs.

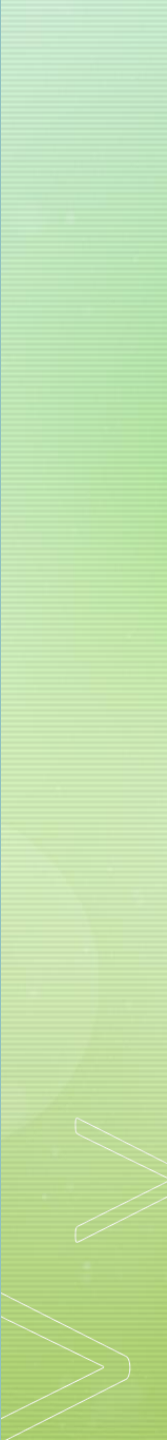

Problem Statement

- Fake websites trick users.
- Personal information can be stolen.
- Need to identify phishing URLs.

Objectives

- Detect phishing URLs.
 - Protect users from fake websites.
 - Improve cyber security awareness.
- 

Technologies Used

- Python
- GitHub
- VS Code

System Flow

- User enters URL
- System checks suspicious keywords
- Displays Safe or Phishing result

Working

- Enter website URL
- Check phishing keywords
- Display detection result

Advantages

- Easy to use
- Fast detection
- Beginner friendly

Limitations

- Keyword based detection
- Not AI based
- Limited accuracy

Future Scope

- Machine Learning integration
- Real time URL scanning
- Cloud database support

Applications

- Cyber Security
- Educational projects
- Security awareness

Conclusion

- Detects suspicious URLs
- Improves online safety
- Simple and effective project
